## **DETAILED ACTION**

This Office action is in response to the amendment filed September 29, 2006 in which claims 1-7 were amended and claims 8 and 9 were added. The previous 112 rejection is withdrawn in view of the amendment to the claims.

## Claim Rejections - 35 USC § 112

- 1. The following is a quotation of the second paragraph of 35 U.S.C. 112:
  - The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 2. Claims 1, 9 and their dependents are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 1 is rejected because the language "n is an integer from 1 and 5" is indefinite.

Claim 9 is rejected because it is not clear if Applicant is referring to the actually filter size (5 microns ?) or if Applicant means the pore size of the filter. Clarification is required.

## Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Application/Control Number: 10/718,559

Art Unit: 1714

4. Claims 1-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stidham (US 6,127,560) in view of Srivastava, Appal Energy and Anyang General.

Page 3

In certain circumstances, references cited to show a universal fact need not be available as prior art before applicant's filing date. In re Wilson, 311 F.2d 266, 135 USPQ 442 (CCPA 1962). Such facts include the characteristics and properties of a material or a scientific truism. Some specific examples in which later publications showing factual evidence can be cited include situations where the facts shown in the reference are evidence or that characteristics of prior art products were known, In re Wilson, 311 F.2d 266, 135 USPQ 442 (CCPA 1962). References which do not qualify as prior art because they postdate the claimed invention may be relied upon to show the level of ordinary skill in the art at or around the time the invention was made. Ex parte Erlich, 22 USPQ 1463 (Bd. Pat. App. & Inter. 1992).

Stidham teaches a method for preparing lower alkyl esters of soybean oil fatty acids by an alcoholysis reaction of the soybean fatty acid triglycerides with a lower alcohol which comprises the successive steps of:

- a) comminuting the raw soybeans to crack open their hulls and shatter their kernels;
- b) heating the comminuted soybeans in a high-temperature reactor to elevated temperatures in the range of 235 to 350.degree. F.;
- c) maintaining the soybeans at the elevated temperatures for a period of 1 to 60 minutes;
- d) partially removing the oil contained in the soybeans by mechanical means;
- e) degumming the crude soybean oil to reduce the concentration of phospholipid in the

oil;

f) bleaching the degummed soybean oil to further reduce gums and improve color of the

Page 4

oil;

g) esterifying the fatty acid glycerides of the soybean oil by an alcoholysis reaction with

a lower alcohol in the presence of an alkali catalyst to form fatty acid alcohol esters and

glycerine, the conversion of the fatty acid glyceride being in the range of 90 to 99.5%

h) separating the glycerine from the crude fatty acid esterification products by settling or

other mechanical means;

i) washing, in one or more steps, the crude fatty acid esterification products by trickling

water through the products and allowing the mix of water and fatty acid esterification

products to separate into two phases, washed and purified fatty acid esterification

product and a water phase containing water, contaminants such as glycerine and

unreacted lower alcohol and impurities from the soybean oil used (see claim 1). The

catalyst is sodium hydroxide and the lower alcohol is methanol (see col. 7, lines 31-36).

Stidham teaches the limitations of the claims other than the differences that are

discussed below.

In the first aspect, Stidham differs from the claims in that he does not teach the

density and iodine value of the oil. However, Srivastava teaches the soybean oil has a

density of 0.91 (Table 7) and an lodine value of up to 2000 (see page 116, first full

paragraph).

In the second aspect, Stidham differs from the claims in that he does not teach

all of the process parameters with respect to time and temperature. However,

Art Unit: 1714

differences in temperature and time will not support the patentability of subject matter encompassed by the prior art unless there is evidence indicating such parameters are critical.

In the third aspect, Stidham differs from the claims in that he does not specifically teach purification by centrifuging. However, Stidham does teach purification by settling or other mechanical means (see claim 1(h)). This teaching suggests centrifuging.

In the fourth aspect, Stidham differs from the claims in that he does not teach that the purification step involves bubble washing is a conventional method of purifying esterified and Anyang General teaches that bubble washing and the mist washing of Stidham are art recognized equivalents.

It would have been obvious to one of ordinary skill in the art to select bubble washing as the method of purification because Appal teaches it is a conventional method of purification and Anyang teaches that it and mist washing are equivalent for the purpose of purifying esterified oil.

With respect to the size of the bubbles, it would have been obvious to one of ordinary skill in the art at the time the invention was made to optimize the size of the bubbles through routine experimentation for the best results. As to optimization of the results, a patent will not be granted based upon the optimization of result effective variables when the optimization is obtained through routine experimentation unless there is a showing of unexpected results which properly rebuts the *prima facie* case of obviousness. See *In re Boesch*, 617 F.2d 272, 276, 205 USPQ 215, 219 (CCPA 1980).

Application/Control Number: 10/718,559

Art Unit: 1714

See also *In re Woodruff*, 919 F.2d 1575, 1578, 16 USPQ2d 1934, 1936-37 (Fed. Cir. 1990), and *In re Aller*, 220 F.2d 454, 456, 105 USPQ 233, 235 (CCPA 1955).

5. Claims 6 and 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stidham in view of Klok (US 5,116,546).

Stidham has been discussed above. Stidham fails to teach purification by microfiltration. However, Klok teaches that the methyl ester of a transesterification process is filtered (see Examples 1 and 2). While Klok is silent with respect to microfiltration, the general teaching of filtration encompasses microfiltration and the skilled artisan recognizes the pore size of the filter that would be required to filter the methyl ester.

6. Applicant's arguments have been fully considered but they are not persuasive.

Applicant argues that neither Stidham nor Srivastava teach or suggest purification by bubble washing .

The examiner agrees. However, Appal and Anyang teach that it is well known to purify the methyl ester by bubble washing.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Cephia D. Toomer whose telephone number is 571-272-1126. The examiner can normally be reached on Monday-Thursday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Vasu Jagannathan can be reached on 571-272-1119. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information

system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
